NGINX Deployment

Project 1

Student: Myles Locher

Goal

Run and deploy the PHP API through NGINX instead of the built-in PHP server that was being used for development.

NGINX config

```
server {
    listen 80;
    server_name localhost;
    root /mnt/c/Users/loche/phpProject/code;
    index index.php;

    location / {
        try_files $uri $uri/ /index.php?$query_string;
    }

    location ~ \.php$ {
        fastcgi_pass unix:/run/php/php8.5-fpm.sock;
        include snippets/fastcgi-php.conf;
    }
}
```

Starting the server

```
sudo systemctl restart php8.5-fpm
sudo nginx -t
sudo systemctl restart nginx
```

Screen Capture

```
curl -i http://localhost/events/1
```

```
myleslocher@myleslaptop:/mnt/c/Users/loche/phpProject$ curl -i http://localhost/events/1
HTTP/1.1 200 OK
Server: nginx/1.28.3 (Ubuntu)
Date: Wed, 21 Oct 2026 21:19:37 GMT
Content-Type: application/json
Transfer-Encoding: chunked
Connection: keep-alive
